

■ CSV

- 몇가지 필드를 comma(,)로 구분한 텍스트 데이터 또는 파일
- Comma Separated Variables
- MS Excel과 같은 스프레드시트, 데이터베이스 소프트웨어에서 많이 사용
- Tab Separated Values(TSV), Space Separated Values(SSV) 등을 합쳐서 Character Separated Values(CSV)라고 부르기도 한다

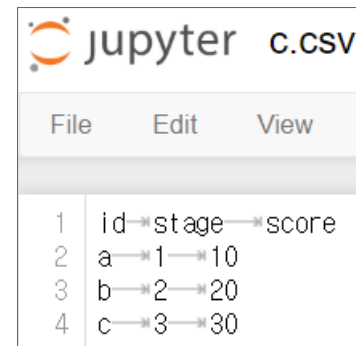

The image shows a Jupyter notebook window titled 'a.csv'. It has a menu bar with 'File', 'Edit', and 'View'. Below the menu bar is a table with 4 rows and 2 columns. The first column contains line numbers 1 through 4. The second column contains the CSV data: 'id,stage,score', 'a,1,10', 'b,2,20', and 'c,3,30'.

| | id,stage,score |
|---|----------------|
| 1 | id,stage,score |
| 2 | a,1,10 |
| 3 | b,2,20 |
| 4 | c,3,30 |

The image shows a Jupyter notebook window titled 'b.csv'. It has a menu bar with 'File', 'Edit', and 'View'. Below the menu bar is a table with 4 rows and 2 columns. The first column contains line numbers 1 through 4. The second column contains the CSV data: 'id stage score', 'a 1 10', 'b 2 20', and 'c 3 30'.

| | id stage score |
|---|----------------|
| 1 | id stage score |
| 2 | a 1 10 |
| 3 | b 2 20 |
| 4 | c 3 30 |

The image shows a Jupyter notebook window titled 'c.csv'. It has a menu bar with 'File', 'Edit', and 'View'. Below the menu bar is a table with 4 rows and 2 columns. The first column contains line numbers 1 through 4. The second column contains the CSV data: 'id→stage→score', 'a→1→10', 'b→2→20', and 'c→3→30'.

| | id→stage→score |
|---|----------------|
| 1 | id→stage→score |
| 2 | a→1→10 |
| 3 | b→2→20 |
| 4 | c→3→30 |

■ 데이터 불러오기

● comma(,) 구분

```
df = pd.read_csv('data/friend_list.csv')  
df
```

| | name | age | job |
|---|-------|-----|-----------|
| 0 | John | 20 | student |
| 1 | Jenny | 30 | developer |
| 2 | Nate | 30 | teacher |
| 3 | Julia | 40 | dentist |
| 4 | Brian | 45 | manager |
| 5 | Chris | 25 | intern |

| | |
|--------------------------------------|--------------------|
| jupyter friend_list.csv ✓ 03/30/2018 | |
| File Edit View Language | |
| 1 | name,age,job |
| 2 | John,20,student |
| 3 | Jenny,30,developer |
| 4 | Nate,30,teacher |
| 5 | Julia,40,dentist |
| 6 | Brian,45,manager |
| 7 | Chris,25,intern |

■ 데이터 불러오기

● comma(,) 구분

```
df = pd.read_csv('data/friend_list.txt') # 확장자 txt  
df
```

| | name | age | job |
|---|-------|-----|-----------|
| 0 | John | 20 | student |
| 1 | Jenny | 30 | developer |
| 2 | Nate | 30 | teacher |
| 3 | Julia | 40 | dentist |
| 4 | Brian | 45 | manager |
| 5 | Chris | 25 | intern |

| | |
|--------------------------------------|--------------------|
| jupyter friend_list.txt ✓ 03/30/2018 | |
| File Edit View Language | |

| 6 | Brian,45,manager |
| 7 | Chris,25,intern |

■ 데이터 불러오기

● tab(Wt) 구분

```
df = pd.read_csv('data/friend_list_tab.txt', delimiter='\\t')  
df
```

| | name | age | job |
|---|-------|-----|-----------|
| 0 | John | 20 | student |
| 1 | Jenny | 30 | developer |
| 2 | Nate | 30 | teacher |
| 3 | Julia | 40 | dentist |
| 4 | Brian | 45 | manager |
| 5 | Chris | 25 | intern |

| jupyter friend_list_tab.txt ✓ 03/30/20 | |
|--|--------------------|
| File Edit View Language | |
| 1 | name→age→job |
| 2 | John→20→student |
| 3 | Jenny→30→developer |
| 4 | Nate→30→teacher |
| 5 | Julia→40→dentist |
| 6 | Brian→45→manager |
| 7 | Chris→25→intern |

delimiter 미사용

| | name age job |
|---|----------------------|
| 0 | John\t20\tstudent |
| 1 | Jenny\t30\tdeveloper |
| 2 | Nate\t30\tteacher |
| 3 | Julia\t40\tdentist |
| 4 | Brian\t45\tmanager |
| 5 | Chris\t25\tintern |

■ 데이터 불러오기

● 공백 구분

```
df = pd.read_csv('data/friend_list_space.txt', delimiter=' ')\ndf
```

| | name | age | job |
|---|-------|-----|-----------|
| 0 | John | 20 | student |
| 1 | Jenny | 30 | developer |
| 2 | Nate | 30 | teacher |
| 3 | Julia | 40 | dentist |
| 4 | Brian | 45 | manager |
| 5 | Chris | 25 | intern |

| jupyter friend_list_space.txt ✓ Last | |
|--------------------------------------|-------------------------|
| | File Edit View Language |
| 1 | name age job |
| 2 | John 20 student |
| 3 | Jenny 30 developer |
| 4 | Nate 30 teacher |
| 5 | Julia 40 dentist |
| 6 | Brian 45 manager |
| 7 | Chris 25 intern |

delimiter 미사용

| | name age job |
|---|--------------------|
| 0 | John 20 student |
| 1 | Jenny 30 developer |
| 2 | Nate 30 teacher |
| 3 | Julia 40 dentist |
| 4 | Brian 45 manager |
| 5 | Chris 25 intern |

■ 데이터 불러오기

● 제목이 없는 경우

```
df = pd.read_csv('data/friend_list_no_head.csv', header=None)  
df
```

| | 0 | 1 | 2 |
|---|-------|----|-----------|
| 0 | John | 20 | student |
| 1 | Jenny | 30 | developer |
| 2 | Nate | 30 | teacher |
| 3 | Julia | 40 | dentist |
| 4 | Brian | 45 | manager |
| 5 | Chris | 25 | intern |

| jupyter friend_list_no_head.csv✓ | |
|----------------------------------|-------------------------|
| | File Edit View Language |
| 1 | John,20,student |
| 2 | Jenny,30,developer |
| 3 | Nate,30,teacher |
| 4 | Julia,40,dentist |
| 5 | Brian,45,manager |
| 6 | Chris,25,intern |
| 7 | |

header 미사용

| | John | 20 | student |
|---|-------|----|-----------|
| 0 | Jenny | 30 | developer |
| 1 | Nate | 30 | teacher |
| 2 | Julia | 40 | dentist |
| 3 | Brian | 45 | manager |
| 4 | Chris | 25 | intern |

■ 데이터 저장하기

● 저장할 DataFrame 생성

```
list = [  
    ['kim', 20, 'designer'],  
    ['lee', 21, 'programmer'],  
    ['park', 22, 'dba']  
]  
df = pd.DataFrame(list, columns=['name', 'age', 'job'], index=[1, 2, 3])  
df
```

| | name | age | job |
|---|------|-----|------------|
| 1 | kim | 20 | designer |
| 2 | lee | 21 | programmer |
| 3 | park | 22 | dba |

■ 데이터 저장하기

● 기본 사용

```
df.to_csv('data/save.csv')
```

| jupyter save.csv✓ | |
|-------------------------|---------------------|
| File Edit View Language | |
| 1 | ,name,age,job |
| 2 | 1,kim,20,designer |
| 3 | 2,lee,21,programmer |
| 4 | 3,park,22,dba |
| 5 | |

● header(columns) 및 index 미사용

```
df.to_csv('data/save_no_head_index.csv',  
         header=False, index=False)
```

| jupyter save_no_h | |
|-------------------------|-------------------|
| File Edit View Language | |
| 1 | kim,20,designer |
| 2 | lee,21,programmer |
| 3 | park,22,dba |
| 4 | |

■ 데이터 저장하기

● None Value 처리

```
list = [  
    ['kim', None, 'designer'],  
    ['lee', 21, 'programmer'],  
    ['park', 22, None]  
]  
df = pd.DataFrame(list, columns=['name', 'age', 'job'], index=[1, 2, 3])  
df
```

| | name | age | job |
|---|------|------|------------|
| 1 | kim | NaN | designer |
| 2 | lee | 21.0 | programmer |
| 3 | park | 22.0 | None |

■ 데이터 저장하기

● 기본 사용

```
df.to_csv('data/save_none_value1.csv')
```

| jupyter save_none | |
|-------------------------|-----------------------|
| File Edit View Language | |
| 1 | ,name,age,job |
| 2 | 1,kim,,designer |
| 3 | 2,lee,21.0,programmer |
| 4 | 3,park,22.0, |
| 5 | |

● header(columns) 및 index 미사용

```
df.to_csv('data/save_none_value2.csv', na_rep='-')
```

| jupyter save_none | |
|-------------------------|-----------------------|
| File Edit View Language | |
| 1 | ,name,age,job |
| 2 | 1,kim,-,designer |
| 3 | 2,lee,21.0,programmer |
| 4 | 3,park,22.0,- |
| 5 | |
